PROTOTYPE, invented data. Report data run-2026-10-17-01.

Conversion sign-off: Example Retail Ltd

SQL Server to PySpark on Databricks. Run finished 2026-10-17.

2 of 7 items are converted and checked. 3 are still with us, and 2 need manual work.

Converted and checked (2)

Ready to use. Converted code behaved exactly like the original on every test.

- **Creates an order with its lines and reduces stock.** (sales.uspCreateOrder) see note
- **Monthly revenue per region.** (sales.vMonthlyRevenue) see note

Not converted yet: our work (2)

We are fixing these. Nothing is needed from you.

- **Moves orders older than a cut-off date into the archive tables.** (sales.uspArchiveOrders) 3 rows that should have been archived were left behind.
- **Applies a staged price list to the product table.** (ref.uspApplyPriceImport)

Waiting on another item (1)

These depend on an item above and are checked once it is fixed.

- **Summarises an order for the confirmation e-mail.** (sales.uspOrderSummary)

Manual work (2)

The tool cannot convert these. A person has to.

- **Searches product descriptions.** (dbo.uspSearchProducts)
- **Nightly load of the day's sales from the till system.** (LoadDailySales.dtsx)

What we need from you

- **Extract the database ArchiveDB.** 2 procedures read it; extracting it would make them reconcilable.
- **Export identity starting values at cutover.** Needed so new order numbers continue from the live system's, not from the highest number in the data.

Issues we found in the existing system

These are in your current code, not caused by the conversion. The converted code behaves the same way.

- **Monthly revenue per region.** In the original, monthly totals do not add up to the yearly total when an order is refunded in a later month. The conversion reproduces this.

One condition for the converted code

During a run, converted code is the only writer to the tables it writes. Emulated transactions, identity values and constraint checks are correct only while this holds.
